

The Next Generation of Application Performance Management for Mobile Applications

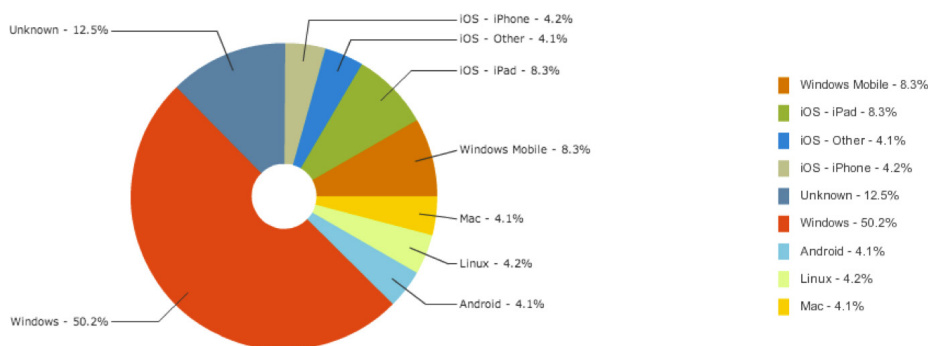

Mobile applications now account for 15% of all Internet traffic, with 1.5 billion users worldwide. This means that the performance of mobile applications is more important than ever both to the end users and to the companies that depend on them for their revenue.

Introducing AppDynamics for Mobile

With AppDynamics for Mobile you can now get insights into the performance of your native mobile apps for iOS and Android, allowing you to ensure that your mobile users have a great experience from the moment they open the application.

The complexity of modern applications makes end-to-end monitoring essential for all production applications, whether they're run in a browser or on a smartphone.

With AppDynamics for Mobile, you get complete visibility into the end user experience across mobile and web with the end user experience dashboard.

Key Benefits

- **End User Experience Monitoring** - Get complete visibility into the end user experience of your iOS and Android users globally in real-time
- **Crash Reporting** - Understand the root cause of application crashes and hangs
- **Network Request Snapshots with server-side correlation** - Get end to end visibility from the mobile device all the way to multiple tiers on the server-side
- **Device & User Analytics** - Analytics on device, carriers, OS, and application versions
- **Custom Metrics** - Track any custom metrics and leverage dynamic baselining for anomaly detection

Support Matrix

- iOS 5.1.1+
- Android 2.3.3+
